FACILITY: NCP Network Control Program (NCP)

ABSTRACT:

NCP Library of common definitions

ENVIRONMENT: VAX/VMS Operating System

AUTHOR: Darrell Duffy , CREATION DATE: 28-August-1979

MODIFIED BY:

V03-031 PRD0112 Paul R. DeStefano 31-Jul-1984 Allow node address and executive node address of 0.

V03-030 PRD0104 Paul R. DeStefano 18-Jul-1984 Allow underscores ("'') to be included in group, network, and destination names.

V03-029 PRD0050 Paul R. DeStefano 05-Feb-1984
Added state expression to parse OBJECT parameter as a number.
Changed ACT\$GL_NODADR_Q to more general name ACT\$GL_ADR_Q.

V03-028 RPG0028 Bob Grosso 10-Jun-1983 Add service device UNA.

*5

NC

MA

ZN

AN

- V03-027 RPG0027 Bob Grosso 22-Mar-1983
 Turn off BLANKS after termination of state expression macro to parse NI addresses.
- V03-026 RPG0026 Bob Grosso 16-Mar-1983 Update NCP version number to IV. Complete state expression macro to parse NI addresses.
- V03-025 RPG0025 Bob Grosso 10-Mar-1983 Add state expression macro to parse NI addresses.
- V03-024 RPG0024 Bob Grosso 25-Feb-1983
 Remove syntax checking for NODE id and correct
 parsing of circuit names.
 Note, this packet cannot be backed off without taking
 RPG0023 with it.
- V03-023 RPG0023 Bob Grosso 18-feb-1983
 Remove syntax checking for line-id and circuit-id.
 Change High range for node adr from 255 to 1023.
 Add high and low for LINE BFS.
 Add high and low for NODE FBS and SBS.
- V03-022 RPG0022 Bob Grosso 20-0ct-1982
 Allow '\$' and '_' in object names. Allow 12 character object names.
 Have SE_NODE_ADR flag Area present in node address.
- V03-021 RPG0021 Bob Grosso 23-Sep-1982
 Parse for node area.
 Range for Module Console RTR
- V03-020 RPG0020 Bob Grosso 15-Sep-1982 Increase tracepoint name length to 30 from 16.
- V03-019 RPG0019 Bob Grosso 03-Sep-1982
 Add range for LIN RTT.
 Change range for MTR BSZ.
 Add SEM_HEX_NUM and LEN_HEX_NUM to parse hex numbers.
- V03-018 TMH0018 Tim Halvorsen 16-Aug-1982 Change tracepoint name parsing to accept a string of any size, including periods as legal characters.
- V03-017 RPG0017 Bob Grosso 03-Aug-82
 Add range for Module X25-Protocol MCI.
 Change QUERY STATES S to allow different ALL prompt strings to support sub-databases.
- V03-016 RPG0016 Bob Grosso 23-Jul-82 Support X25-Trace with subexpression for tracepoint names, SEM_TRCPNT_NAME.
- V015 RPG0015 Bob Grosso 14-Jul-82 Add NI support in Set Node by adding range values for

AMC, AMH, BRT, MAR, MBE, MBR.

- VO14 RPG0014 Bob Grosso 15-Jun-82
 Add MODULE parameter table.
 Add macro QUERY_STATES_S patterned after QUERY_STATES to permit alternate prompting within entities without having multiply defined states.
 Add Subexpression and constant for channels lists.
- V013 TMH0013 Tim Halvorsen 05-Apr-1982
 Add ACT\$TESTLONG action routine to ACT_DFN macro.
 Allow numeric characters in line/circuit mnemonic.
 Add circuit MRT and RPR ranges.
 Allow any characters following initial dash after line/circuit mnemonic (such as X25-CHICAGO).
- V012 TMH0012 Tim Halvorsen 08-Jan-1982
 Remove TMH0005, thus restoring RETRANSMIT TIMER
 to a line parameter, which is what NM V3.0 finally
 came up with.
- VO11 TMH0011 Tim Halvorsen 31-Dec-1981 Add DMF as a MOP service device.
- V010 TMH0010 Tim Halvorsen 25-Nov-1981
 Allow embedded spaces in filespecs as long as they appear in double quotas (access control string).
 This allows access control strings to be specified in the filespec after the TO clause in the SHOW command.
- V009 TMH0009 Tim Halvorsen 22-Oct-1981 Fix HEX_PSW sub-expression so that blank which terminates hex password string does not get included in string.
- V008 LMK0001 Len Kawell 19-Sep-1981 Change NICE version to 3.0.
- V007 TMH0007 Tim Halvorsen 28-Aug-1981 Add macro to parse link ID
- V006 TMH0006 Tim Halvorsen 15-Aug-1981 Add DMP, DMV and DPV service devices. Add EXECUTOR PIPELINE QUOTA range.
- V005 TMH0005 Tim Halvorsen 05-Aug-1981 Change RETRANSMIT TIMER to a circuit parameter from a line parameter.
- V004 TMH0004 Tim Halvorsen 07-Jul-1981 Rename maximum blocks to maximum transmits Allow dashs in circuit names.
- V003 TMH0003 Tim Halvorsen 11-Jun-1981 Add ranges for new V2.2 circuit parameters. Remove obsolete line polling parameters. Change NCP version number to 2.2.0

XSBITL 'Macros to Build State Tables'
           Macros to help build state tables
     For the following macros:
     CLS
                     Code for the sub-command
                     Parameter name
     All state names have the form ST_CLS...
There are two types of states, prompt and process. Prompt states
     sequence the prompts for parameters. Process states allow any
     parameter in any order.
          Build a sequence of prompt states
           A prompt is printed and then it is parsed. No answer is required
          and if none is given the next prompt is issued. If the response is "DONE" then the remainder of the prompts are skipped and the function is performed.
MACRO
     PROMPT_STATES (CLS) [NAM] =
SSTATE (%NAME ('ST', CLS, '_PMT_', NAM), (TPAS_LAMBDA, ACTSPRMPT, , , %NAME ('PMTSG_', CLS, '_', NAM))
          ):
SSTATE
          (TPAS_SYMBOL, XNAME ('ST_', CLS, 'DOIT'), ACTSPMTDONEQ ), ((XNAME ('ST_', CLS, '_, NAM))),
           (TPAS_EOS),
           (TPAS_LAMBDA, %NAME ('ST', CLS, 'PMT_', NAM), ACTSSIGNAL, , , NCPS_INVVAE)
          );
     %:
```

Build a pair of states to accomplish command prompting

The idea is to cause prompting only if the state is entered with TPA\$_EOS true. If prompting is true, then the state should loop until either a transition is satisfied or the command is canceled. This is done by using ACT\$PMT_ON and Off to remember the state of prompting and ACT\$PMT_Q to act on that state to either fail (not prompting) or succeed and issue and error message (prompting).

```
MACRO
```

COMMAND_PROMPT (CLS, NAM, STATUS) =

SSTATE (%NAME ('ST_', CLS, ', NAM), (TPAS_EOS, ACTSPMT_ON), (TPAS_LAMBDA, ACTSPMT_OFF),

\$STATE (%NAME ('ST_', CLS, '_', NAM, '_1'),

*REMAINING

(TPAS_EOS, %NAME ('ST_', CLS, ', NAM, '1'),
ACTSPRMPT, , %NAME ('PMTSG_', CES, ', NAM)),
(TPAS_LAMBDA, %NAME ('ST_', CLS, ', NAM, '1'),
ACTSPMT_Q, , STATUS));

%:

35

LI

```
Build sequence of Query states
Query states are states which save a parameter
if the answer to a prompt is YES. No parameter is
saved for NO or CR. If the response is "DONE" then
the remainder of the queries are skipped and the function
             is performed.
MACRO
            QUERY_STATES (CLS) [NAM] =
$STATE (%NAME ('ST_', CLS, 'PMT_', NAM), (TPA$_LAMBDA, , ACT$PRMPT, , CLS, '_', NAM))
            );

*SBITL 'Macros to Build Parameter Control Blocks'

Build parameter blocks

There are four structures associated with building messages:

SDB Set/Define Block

This block is a parameter to the verb routines. It serves to point to other structures and to declare the type of the entity so that message headers can be properly built.

PDB Parameter Data Block

This is a data area which holds the actual parameter data. The block is a status byte followed by the data as it appears in the message. The action routine ACT\$SAVPRM stores the data in this block in the correct format.

PBK Parameter Block

This block is a parameter to ACT\$SAVPRM and directs the storage of the parameter in the PDB. It contains the type of the parameter, the PDB address and an optional parameter for the type code.

PCL Parameter Control List

This block is a list of items which control the building of messages. Each entry is a parameter type code, the parameter ID code and the PDB address. Using this block the routines which build messages are able to add parameter values or codes to the end of messages in the proper format.

N(

%SBTTL 'Macros to Build Subexpressions'

The state tables for the NCP language have been broken into smaller modules to reduce compile time of the separate modules to reduce development time. The development time has been reduced at the expense of a slight increase in the size of the tables since keywords and subexpression states are duplicated in the separate tables.

These macros define whole state subexpressions to parse useful entities. Including these subexpressions as macros in the library avoids having multiple copies of the source of the subexpressions in each of the modules of the states tables where they are used.

States and subexpressions are named in a distinctive way. States are named ST_xxx. Subexpressions are named SE_xxx and subexpression defining macros are named SEM_xxx.
